

Topic: Custom Management Command 8: Importing Large Data Using Celery & Redis

Speaker: Udemy Instructor Rathan Kumar / Notebook: Django: Automating Common Tasks

1. After we installed REDIS, we installed REDIS as a package in our VIRTUAL ENVIRONMENT.

```
(env)
Rosilie@DELL MINGW64 C:/Users/Rosilie/AppData/Local/Programs/Microsoft VS Code (main)
$ pip install redis
Collecting redis
  Downloading redis-5.0.8-py3-none-any.whl (255 kB)
    |████████████████████| 255 kB 1.7 MB/s
Collecting async-timeout>=4.0.3
  Downloading async_timeout-4.0.3-py3-none-any.whl (5.7 kB)
Installing collected packages: async-timeout, redis
Successfully installed async-timeout-4.0.3 redis-5.0.8
WARNING: You are using pip version 21.2.4; however, version 24.2 is available.
You should consider upgrading via the 'C:\Users\Rosilie\OneDrive\Desktop\LEARNING DJANGO PROJECTS\AutomatingComm
onTasks\env\Scripts\python.exe -m pip install --upgrade pip' command.
(env)
Rosilie@DELL MINGW64 C:/Users/Rosilie/AppData/Local/Programs/Microsoft VS Code (main)
$
* History restored
```

2. You installed CELERY.

```
$ pip install celery
```

3. Run this to create a Celery Worker:

windows:

```
$ celery -A autocommontasks_main worker --loglevel=info --pool=solo
```

macos:

```
$ celery -A autocommontasks_main worker --loglevel=info
```

This results to this with an error:

```

(cnv)
Rosilie@DELL MINGW64 C:/Users/Rosilie/AppData/Local/Programs/Microsoft VS Code (main)
$ celery -A autocommontasks_main worker --loglevel-info --pool=solo
[2024-08-13 15:52:03.052: WARNING/MainProcess] No hostname was supplied. Reverting to default 'localhost'

-----
```

5. To use CELERY for testing in our project, create a new URL in our root project's URLS.PY

```
15 ... 2. Add a URL to urlpatterns: path('blog/', include('blog.urls'))  
16 ...  
17 from django.contrib import admin  
18 from django.urls import path, include  
19 from . import views  
20 from django.conf.urls.static import static  
21 from django.conf import settings  
22  
23 urlpatterns = [  
24     path('admin/', admin.site.urls),  
25     path('', views.home, name='home'),  
26     # Links to our dataentry app's URLS.PY  
27     path('', include('dataentry.urls')),  
28     path('celery-test/', views.celery_test),  
29 ] + static(settings.MEDIA_URL, document_root=settings.MEDIA_ROOT)  
30
```

We run our django server and att the url in our browser: <http://127.0.0.1:8000/celery-test/>

6. Now update our CELERY_TEST FUNCTION to perform time-consuming operations.

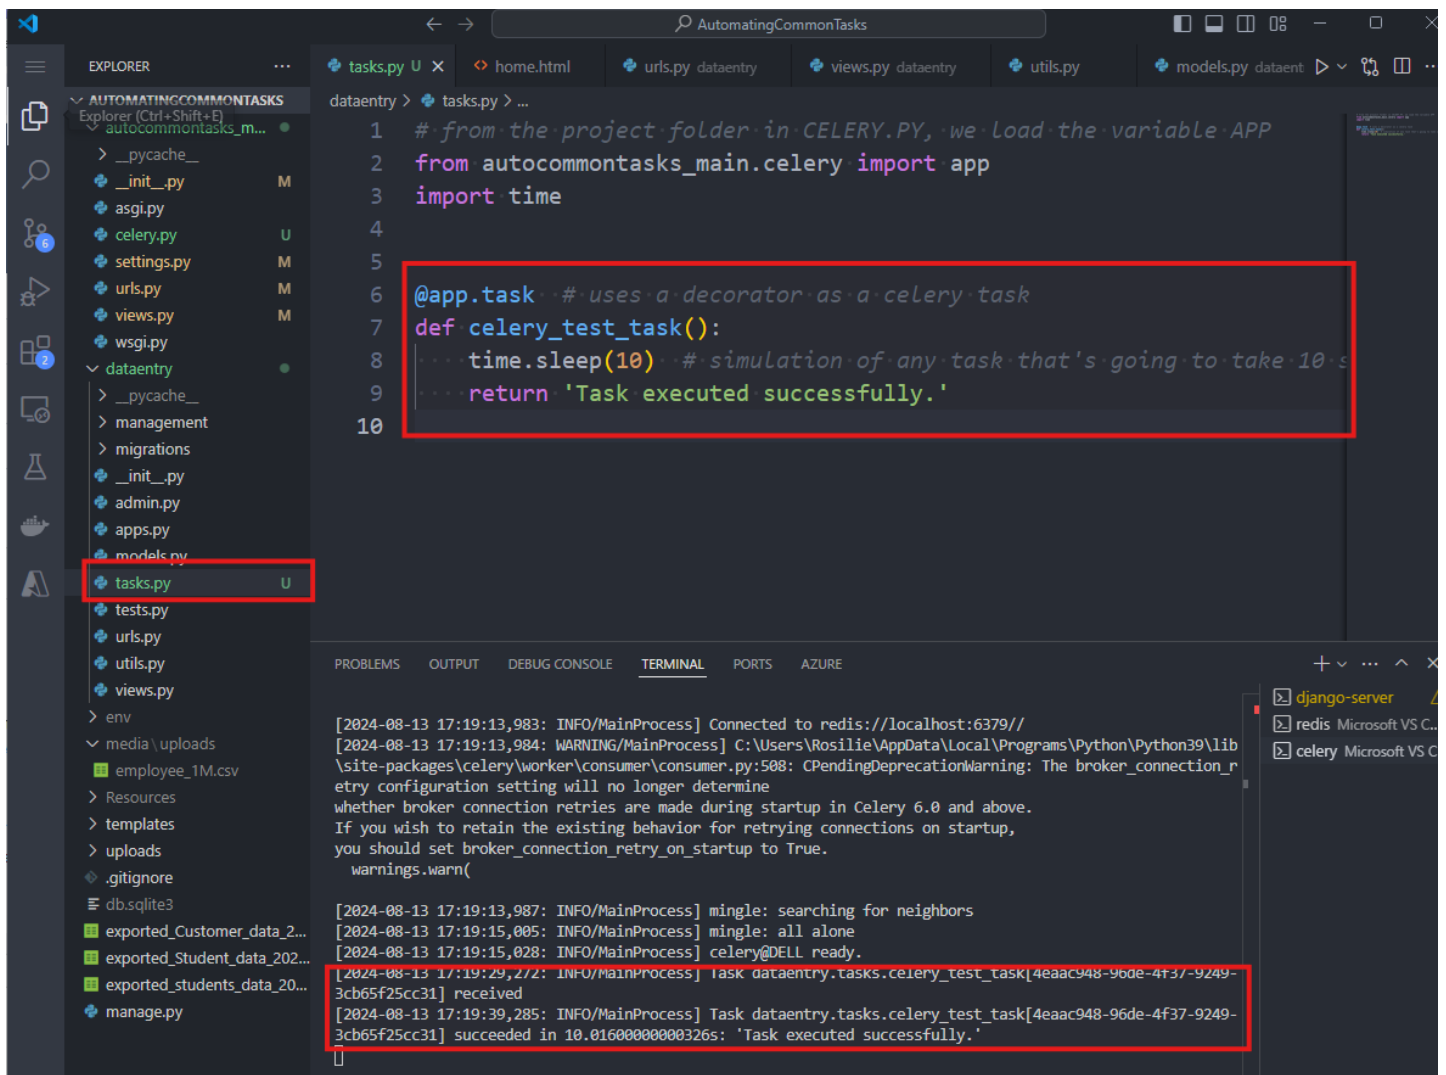

So, when you reload your page, in the background, it will load 10 seconds (Sleep)

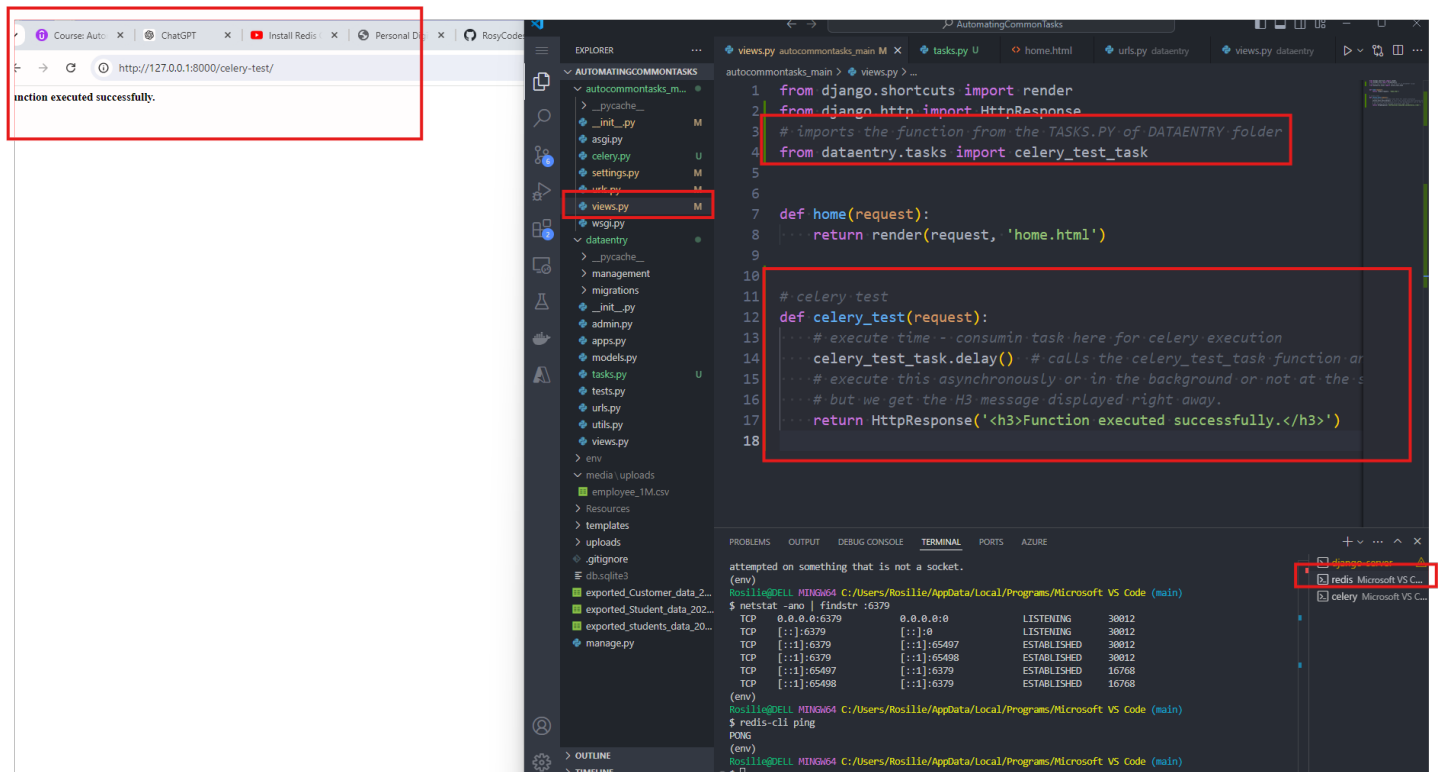

Function executed successfully.

7. We want to pass then the SLEEP(10) TASK to celery, so that our project or user can do or see other things while Celery is working on something else. To do this, in the DATAENTRY folder, create a new file, TASKS.PY and update as

8. To test all this, LOAD your URL <http://127.0.0.1:8000/celery-test/> again, click on your CELERY TERMINAL, and it should RECEIVE and DISPLAY the message 'TASK EXECUTED SUCCESSFULLY' while we were our webpage with H3 tag showing the message right away.

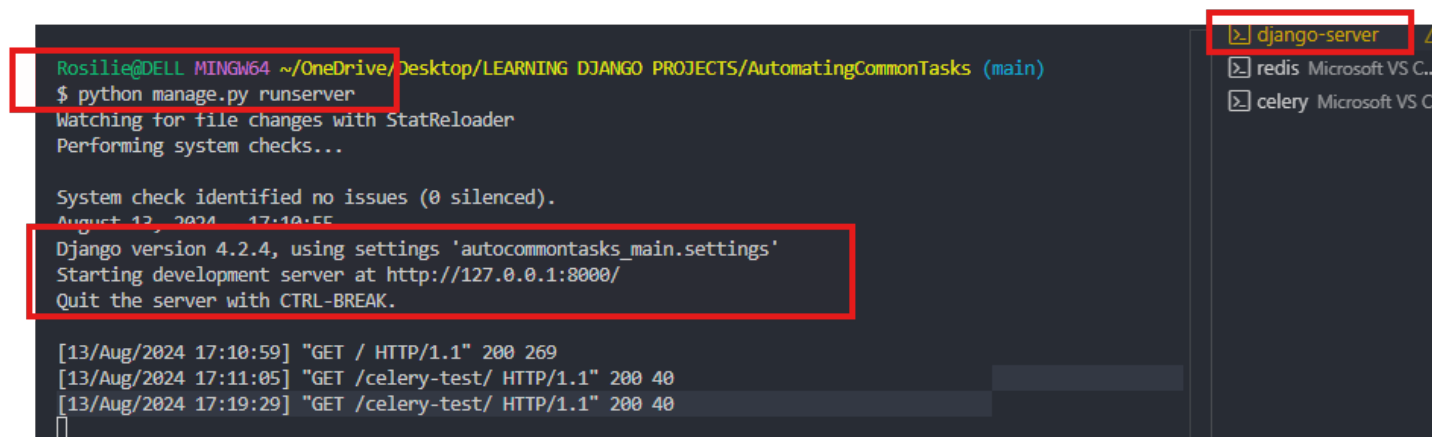

IMPORTANT REMINDER:

So, when you run your django project with celery and redis, THERE SHOULD BE 3 BASH TERMINALS AND YOU NEED TO NAME THEM APPROPRIATELY:

1. DJANGO-SERVER- this is where you will run your python server to run your Django project:

```
$ python manage.py runserver
```

```
Rosilie@DELL MINGW64 ~/OneDrive/Desktop/LEARNING DJANGO PROJECTS/AutomatingCommonTasks (main)
$ python manage.py runserver
Watching for file changes with StatReloader
Performing system checks...

System check identified no issues (0 silenced).
August 13, 2024 17:10:55
Django version 4.2.4, using settings 'autocommontasks_main.settings'
Starting development server at http://127.0.0.1:8000/
Quit the server with CTRL-BREAK.

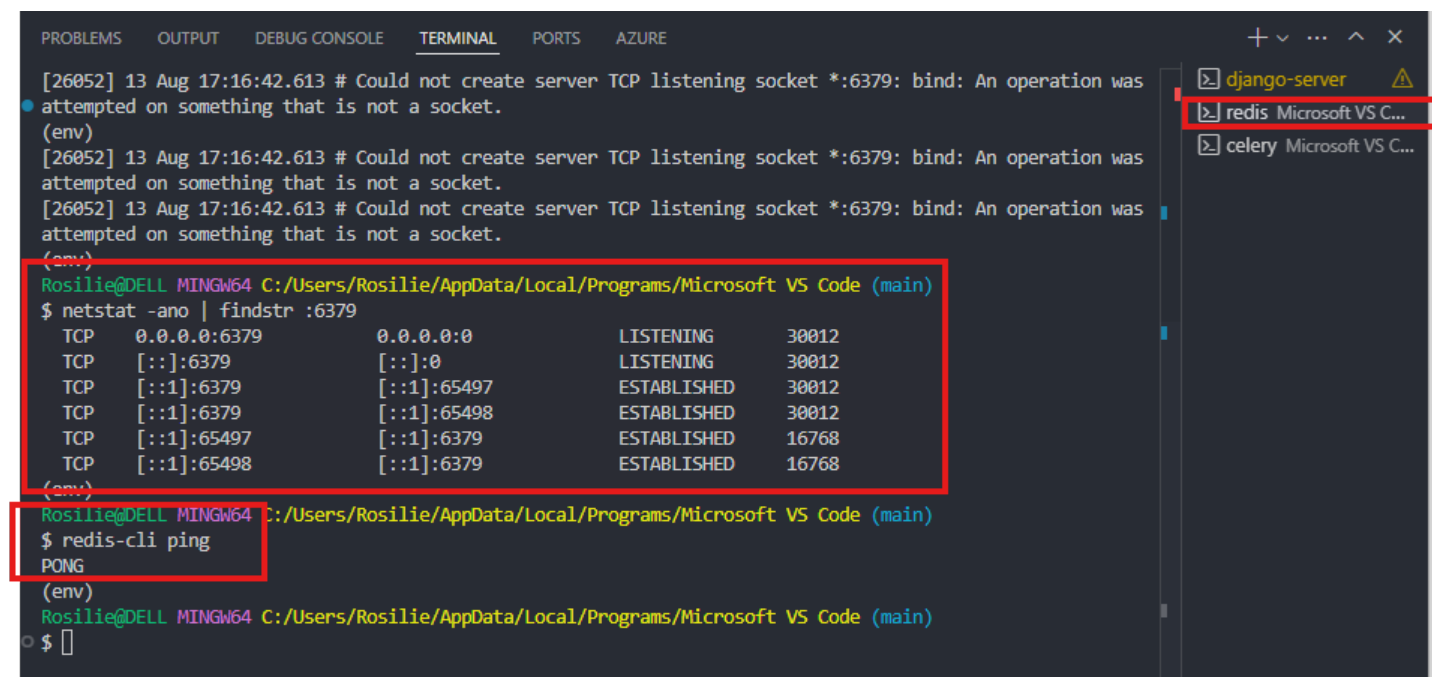

[13/Aug/2024 17:10:59] "GET / HTTP/1.1" 200 269
[13/Aug/2024 17:11:05] "GET /celery-test/ HTTP/1.1" 200 40
[13/Aug/2024 17:19:29] "GET /celery-test/ HTTP/1.1" 200 40
```

2. REDIS - this is where you run your REDIS-SERVER. Every time you start this, it will create a new process of REDIS, so you can simply kill it or ignore it. As long as when you PING your REDIS SERVER, it returns a PONG message, then you are fine. You have multiple processes (TCP) here because you have started your REDIS-SERVER multiple times.

```
$ redis-server
```

```
$ netstat -ano | findstr :6379 (this is to see what process is listening to the port 6379 (Redis))
```

```
$ redis-cli ping (Run this before you run the REDIS-SERVER so you wont have several TCPs)
```

```
[26052] 13 Aug 17:16:42.613 # Could not create server TCP listening socket *:6379: bind: An operation was attempted on something that is not a socket.
(env)

$
```

3. CELERY- this is where you will run this code whenever you need to launch a new task or when you reload your Django page. Meaning, you have to launch this command again if you have made new changes to your CELERY TASKS like changing 10 seconds to 5 seconds to see the effect.

*autocommontasks_main - this is your Django Project Name

```
$ celery -A autocommontasks_main worker --loglevel=info --pool=solo
```

```
from django.http import HttpResponse

celery -A autocommtasks_main worker --loglevel=info --pool=solo
